

Proposal: Moving Concordia PSH ERP from Single Branch to Multi-Branch

A concise overview of the next growth phase for the completed single-branch ERP.

Date: 14 August 2026

Summary: The current single-branch ERP has been completed as the operational foundation. The next planned phase is to expand it into a multi-branch system where one main portal can create, manage, and monitor multiple branches while each branch continues using the same ERP modules in its own workspace.

1. Current Achievement

The single-branch ERP milestone is complete. The system now provides a central digital platform for managing day-to-day operations of one branch. This achievement gives the project a stable and proven base for future expansion.

- Single-branch operations are covered through the existing ERP.
- Core modules are available for students, academics, attendance, fees, HR/payroll, finance, hostel/boarding, inventory, front office, examination, configuration, dashboard, and reports.
- Admin login, permissions, module access, data entry, reporting, and print-ready workflows are already part of the system.
- The current ERP can now be treated as the foundation for the next stage instead of being rebuilt from scratch.

Completed Area	Overview
ERP Foundation	A working single-branch system is already in place.
Operational Modules	Daily work such as students, fees, attendance, staff, finance, hostel, exams, and reports can be managed.
Administration	Users and permissions can be managed for controlled access.
Readiness	The system is ready to move toward branch expansion as the next planned phase.

2. Why Multi-Branch Is the Next Step

A single-branch system solves current operational needs. A multi-branch system supports future growth. Instead of running separate systems for each branch, the institution can use one main platform with branch-wise workspaces.

- New branches can be added from one main portal.
- Each branch can run its own daily operations separately.
- Management can view branch-wise and overall progress from one place.
- Reporting becomes easier because all branches follow one system.
- Software maintenance remains simpler because there is one shared platform.

3. Proposed Future Direction

The future plan is to introduce a main portal above the existing ERP. This portal will manage multiple branches. Once a branch is created, its users will work inside their assigned branch workspace using the same ERP modules already available today.

Future Capability	Overview
Main Portal	Central area to create, update, activate, deactivate, and monitor branches.
Branch Profile	Every branch can have its own name, code, address, contact details, status, and settings.
Branch Users	Users can be assigned to one branch or multiple branches depending on policy.
Branch Workspace	Each branch uses the ERP modules separately for its own records.
Overall View	Management can see combined summaries across branches.
Branch Comparison	Branches can be compared through high-level reports and dashboards.

4. Expected Benefits

- Centralized control over all branches.
- Independent branch-level operations.
- Better visibility for management.
- Consistent processes across all branches.
- Reduced duplication of work and software maintenance.
- Clear path to support N branches in the future.

5. High-Level Roadmap

Phase	Focus	Result
Phase 1	Confirm branch rules and management policies.	Clear plan for users, branches, access, and reporting.
Phase 2	Add main portal branch management.	Branches can be created and maintained.
Phase 3	Add branch workspace and branch user access.	Users can work inside assigned branches.
Phase 4	Extend existing ERP modules for branch-wise use.	Current modules become usable for multiple branches.
Phase 5	Add overall summaries and branch comparison views.	Management can monitor branch performance.
Phase 6	Pilot rollout and training.	System can be tested branch by branch before wider rollout.

6. Key Decisions Needed

- Should one user be allowed to manage multiple branches?
- Should roll numbers and challan numbers be branch-wise or globally unique?
- Should financial approvals happen inside each branch or through the main office?
- Should academic structures be shared across branches or configured separately for each branch?
- Should overall branch comparison dashboards be included in the first multi-branch release?

7. Recommendation

The recommended next step is to begin the multi-branch planning and implementation phase. The single-branch system is already complete; expanding it into a multi-branch platform is the natural next phase for growth, better management visibility, and future scalability.
