

Concordia ERP Multi-Branch System Proposal

A product direction pitch for offering a centralized ERP platform that can support multiple branches.

Date: 15 August 2026

Summary: Concordia ERP is being positioned as a multi-branch ERP system. The product is currently in the early phase of this multi-branch direction, with a working single-branch foundation already built. The next step is to extend that foundation into a platform where one main portal can create, manage, and monitor multiple branches.

1. Product Position

The proposed offering is Concordia ERP as a multi-branch management platform. It is not limited to one branch as a product vision. The completed single-branch implementation should be seen as the first foundation layer that proves the main workflows and prepares the product for multi-branch expansion.

- Concordia ERP is the main product name.
- The multi-branch ERP system is the planned offering.
- A single-branch implementation has already been built as the foundation.
- The next development step is to add branch management, branch workspaces, and overall monitoring.

2. What Has Already Been Achieved

The project already has a working ERP implementation for one branch. This existing work covers core operations and gives the multi-branch plan a real base instead of only an idea.

Area	Current Position
ERP Foundation	A working single-branch implementation has already been built.
Operational Coverage	Students, academics, attendance, fees, HR/payroll, finance, hostel/boarding, inventory, front office, examination, configuration, dashboard, and reports are covered.
Administration	User login, permissions, module access, data entry, reporting, and print-ready workflows are available.
Readiness	The existing foundation can now be expanded toward a multi-branch ERP system.

3. Multi-Branch ERP Direction

The multi-branch direction will add a main portal above the existing ERP foundation. This portal will handle branch creation, branch profiles, branch users, and overall monitoring. Each branch will then operate in its own workspace while still being part of the same Concordia ERP platform.

- A main portal can manage N branches.
- Each branch can have its own profile, users, settings, and operational records.
- Branch users can work independently inside their assigned branch workspace.
- Management can view both branch-wise and overall summaries from one platform.
- The same ERP workflows can be reused and extended instead of rebuilding separate systems for every branch.

4. Proposed Future Capabilities

Capability	Overview
Main Portal	Central area to create, update, activate, deactivate, and monitor branches.
Branch Profiles	Every branch can maintain its own name, code, address, contacts, status, and settings.
Branch Users	Users can be assigned to one branch or multiple branches depending on policy.
Branch Workspaces	Each branch can use ERP modules separately for its own daily records.
Overall Dashboard	Management can view combined summaries across branches.
Branch Comparison	Branches can be compared through high-level dashboards and reports.

5. Expected Benefits

- A stronger ERP product offering for institutions with multiple branches.
- Centralized control through one main portal.
- Independent branch-level operations.
- Better management visibility across branches.
- Consistent processes and reporting across all branches.
- Reduced duplication compared with running separate systems for every branch.
- Clear path to support N branches in future phases.

6. High-Level Roadmap

Phase	Focus	Result
Phase 1	Finalize branch rules and management policies.	Clear direction for branch access, users, numbering, approvals, and reporting.
Phase 2	Build main portal branch management.	Branches can be created and maintained from one place.
Phase 3	Add branch workspaces and branch user access.	Users can work inside assigned branches.
Phase 4	Extend existing ERP modules for branch-wise use.	Current workflows become usable across multiple branches.
Phase 5	Add overall summaries and branch comparison views.	Management can monitor all branches from one platform.
Phase 6	Pilot rollout and training.	The multi-branch ERP can be tested branch by branch before wider rollout.

7. Key Decisions Needed

- Should one user be allowed to manage multiple branches?
- Should roll numbers and challan numbers be branch-wise or globally unique?
- Should financial approvals happen inside each branch or through the main office?
- Should academic structures be shared across branches or configured separately for each branch?
- Should overall branch comparison dashboards be included in the first multi-branch release?

8. Recommendation

The recommended next step is to continue Concordia ERP as a multi-branch ERP system. The single-branch implementation has already been built as a strong foundation, and the next phase should focus on branch management, branch workspaces, and overall reporting so the product can support multiple branches through one centralized platform.
